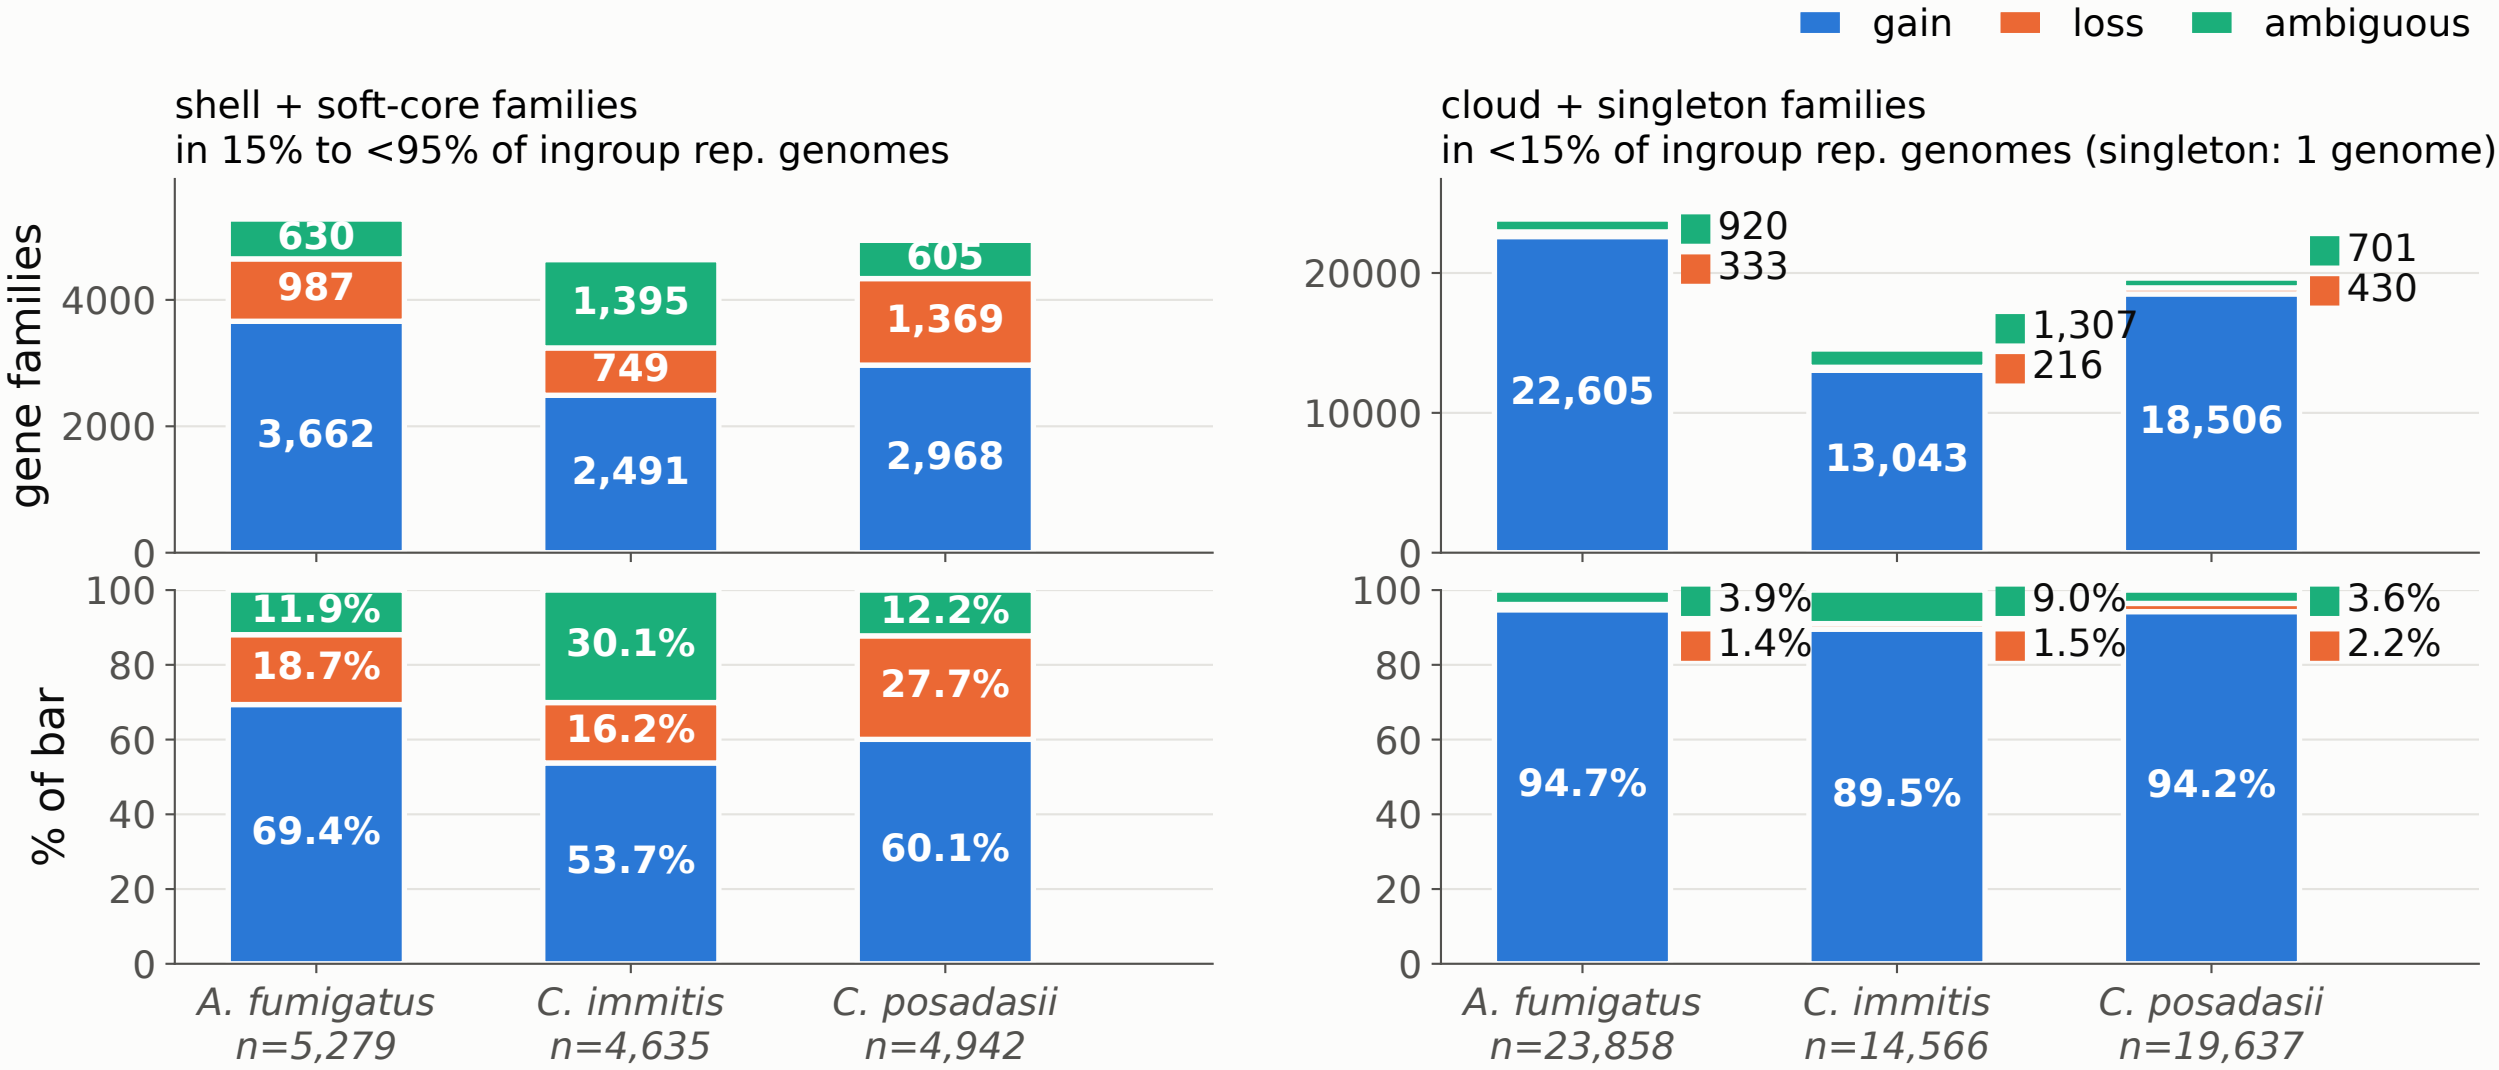
Gain / loss labels: shell + soft-core families shown apart from cloud + singleton families
outgroup-frequency rule: loss if >= 0.9 of outgroup genomes carry the family, gain if <= 0.1, else ambiguous



A. fumigatus: 293 ingroup genomes (121 representatives), outgroup 2 genomes
C. immitis: 169 ingroup genomes (133 representatives), outgroup 360 genomes
C. posadasii: 360 ingroup genomes (278 representatives), outgroup 2 genomes
Limitation: A. fumigatus and C. posadasii: outgroup = 2 genomes, so outgroup frequency is only 0/2, 1/2, 2/2.
gain = in no outgroup genome, loss = in all 2, ambiguous = in some but not all.
